SUMMARY

Senior Unity / C# developer with 6 years shipping and running live mobile titles, including *Lumber Inc* (100M+ downloads on Google Play), where I am second-in-command on the project and mentor 3 developers. Strongest on performance: profiling-led FPS, memory and build-size passes across device tiers. I own gameplay systems end to end, from prototype through live operations, and build the balance and debug tooling designers and QA use to tune them. Puzzle work includes a swipe-to-carve sand prototype built on runtime mesh triangulation, and a 3D packing rebuild of Lumber Inc's storage for non-uniform product shapes.

Shipped: *Lumber Inc* (AppQuantum), 100M+ downloads on Google Play · *Milk Farm Tycoon* (Eastside Games) · *Sport Stars*

SKILLS

Languages: C#, TypeScript, Java, SQL, JavaScript

Engineering: OOP and design patterns (strategy-based system variants, data-driven ScriptableObject architecture), refactoring shipped systems a live game has outgrown, unit tests and automated scenario testing

Performance: CPU / FPS profiling, allocation and GC reduction, draw-call reduction (GPU instancing, texture batching, atlasing, canvas splitting), load-time optimization, build-size auditing

Unity: UGUI / Canvas, Event System, Graphic Raycaster, Addressables, UniTask, DOTween, Animator, HLSL, Editor scripting, Unity Profiler, Unity Test Framework, Firebase (Remote Config, Analytics, Crashlytics), Git

Team: Mentoring and code review, onboarding new joiners, day-to-day technical decisions, first point of contact for QA, designers and artists

EXPERIENCE

Nopowerup, Senior Game Developer

Hanoi, Vietnam · Dec 2022 – Present

Mobile simulation and tycoon games. Unity, C#.

Lumber Inc, idle tycoon, publisher: AppQuantum · 100M+ downloads on Google Play · Aug 2024 – Present

play.google.com/store/apps/details?id=com.lumber.inc (not available on Vietnam store)

- Second-in-command on the project since the prior lead moved on: mentor 3 developers, decide most day-to-day technical questions, and act as the bridge between publisher requests and what the codebase can absorb. One of two regular code reviewers alongside the tech lead, and I onboard new joiners with a codebase walkthrough and first-task pairing.
- Rewrote the live game's package-storage system as a true 3D packing problem. It had shipped as a 2D row/column layout; when the publisher needed non-uniform product shapes that layout could not represent, I replaced it with 3D stacking plus a caching strategy holding warm-up under ~10 KB allocation and a few ms per query across thousands of boxes and 40-50 storage areas.
- Built the forklift coordination system matching storage contents to incoming orders, architected as three coexisting order-fulfillment strategies running as true A/B tests rather than tuned numbers, plus interchangeable logistics-routing strategies, selected by Remote Config and swapped on restart, with losing variants cut once the data is in.
- Performance ownership across FPS, memory and build size: profiling-led CPU and memory passes on the simulation loop, draw-call reduction via GPU instancing and texture batching, canvas splitting, redraw batching and atlasing where the UI itself was the cost, and an Addressables duplication checker that catches direct references to Addressable-only assets before they silently duplicate into the base build.
- Built the designer and QA tooling around the game: a Google-Sheets-to-Unity balance export pipeline designers tune directly, a tap-triggered on-device debug menu for testers to change game state, a mesh combiner, and a scenario-based automated test framework where testers compose scenarios from steps and add their own scripts, extending coverage without an engineer in the loop.

- Delivered client-side live-ops features end to end: the shop, limited-time events, IAP offers and the piggy-bank system with the UI each carries, plus the UI framework the game's screens sit on and its redirect system, which closes open popups, switches tab and scrolls a target into view.
- Triage live crashes from Firebase Crashlytics and run release builds through an in-project build tool (Addressables push, player settings, Android APK, iOS archive). Wrote small HLSL effects, and traced an iOS-only rendering bug to a shader using half4, where the lower precision surfaced as visible pixel artifacts on device.

Milk Farm Tycoon, idle tycoon, publisher: Eastside Games · *Feb 2023 – Aug 2024*

play.google.com/store/apps/details?id=com.eastsidegames.milking

- Built the conveyor and distribution simulation, the battle pass, the transporter-renting system and in-game localization, all against a Beamable backend where player state, progression and economy data persist server-side rather than in a local save.
- CPU optimization on the simulation loop via targeted profiling passes, draw-call reduction via GPU instancing and texture batching, and a fake-shadow-mesh tool to help artists place shadow meshes faster.

Puzzle prototype · *Dec 2022 – Feb 2023*

- Prototyped a puzzle game in the style of *Where's My Perry?*, with sand in place of the liquid: the player swipes to carve away sand so balls can fall through the cuts. Rebuilt the sand mesh at runtime using triangulation as each cut reshaped it.

CodeGym, Unity Instructor (Part-time)

Hanoi, Vietnam · Aug 2023 – Aug 2024

- Taught two cohorts of aspiring developers through Unity and C# game development, from programming fundamentals to their own playable projects, reviewing their work and mentoring one-on-one to unblock progress.

Rainbow Studio, Game Developer

Hanoi, Vietnam · Aug 2020 – Aug 2022

Mobile hyper-casual games (Unity, C#) and web games (Egret engine, TypeScript).

- Gameplay and UI implementation across multiple small titles, plus internal tools for processing raw sprite, animation and game data.
- Ad-network and IAP SDK integration.

SIDE PROJECT

Sport Stars, Unity mobile collection RPG in a sports setting

Aug 2023 – Present

play.google.com/store/apps/details?id=com.bruhs.sportstars

A self-directed, co-developed, shipped side project. Three years in and roughly 1,800 commits, the second-largest contributor on the codebase. Data-driven, ScriptableObject-based architecture.

- Built the RPG layer: a stats-and-abilities system where rarity-tagged ability assets roll onto a card and resolve into per-match runtime behaviours, and the real-time match simulation those stats drive across eight disciplines.
- Reduced load time on low-end Android (Samsung A07-class hardware) from ~35 s to ~20 s, roughly 43% on the device class where load time hurts most, plus CPU optimization across the update loop.
- Built designer-facing balance tooling: Google Sheets with an export script that outputs code designers paste straight into Unity.

EDUCATION

Hanoi University, B.Sc. Computer Science (Software Engineering)

Aug 2018 – Jun 2023

LANGUAGES

English: C1 (professional working proficiency)

Vietnamese: native
